Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

--- PATHWAY: Involved in the gp130-mediated signaling pathway.
--- SUBUNIT: Forms a homodimer or a heterodimer with a related family member (at least STATI). Interacts with NCOA1.
--- SUBCELLUIAR LOCATION: Cytoplasmic; translocated into the nucleus in response to phosphorylation.
Yoshida K., Sudo T., Naruto M., Kishimoto T.; "Molecular cloning of APRF, a novel IFN-stimulated gene factor 3 p91-related transcription factor involved in the gp130-mediated signaling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEQUENCE FROM N.A. (ISOPORM DEL-701), AND VARIANT ILE-143.

-!- TISSUE SPECIFICITY: Heart, brain, placenta, lung, liver, skeletal muscle, Kidney and pancreas.
-!- FTM: Tyrosine phosphorylated in response to IL-6, IL-11, CNTF, LIP, CSF-1, EGF, PDGF, IFN-alpha and OSM. Serine phosphorylation is important for the formation of stable DNA-binding STAT3 homodimers and maximal transcriptional activity.
-!- SIMILARITY: Balongs to the transcription factor STAT family.
-!- SIMILARITY: Contains 1 SH2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Phosphotyrosine (by JAK) (By similarity)

-I- FUNCTION: Transcription factor that binds to the interleukin-6

-I- FUNCTION: Transcription factor that binds to the interleukin-6

(IL-6)-responsive elements identified in the promoters of various acute-phase protein genes. STAT3B interacts with the N-terminal part of JUN to activate such promoters in a cooperative way.

-I- PATHWAY: Involved in the gp130-mediated signaling pathway.

-I- SUBCELLULAR is a homodimer or a heterodimer with a related family member (at least STAT1). Interacts with NCOA1 (By similarity).

-I- SUBCELLULAR LOCATION: Cytoplasmic; translocated into the nucleus in response to phosphorylation.

-I- ALTERNATIVE PRODUCTS:

-I- ALTERNATIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 [8]

Squence=VSP 010475;
Isole=P42127-3; Sequence=VSP 010475;
TISSUE SPECIFICITY: STAT3A is Seen in the liver, spleen, and kidney. STAT3B is also detected in the liver, although in a much less abundant manner.

PTW: Tyrosine phosphorylated in response to IL-6, IL-11, CNTF, ILF, CSF-1, ESF, PDGF, IFN-alpha and OSM. Serine phosphorylation is important for the formation of stable DNA-binding STAT3 in mondiners and maximal transcriptional activity (By similarity). SIMILARITY: Belongs to the transcription factor STAT family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            X-RAY CRYSTALLOGRAPHY (2.25 ANGSTROMS) OF 136-716.

                                                                                                                                                                                                                                                                                                                                                                   The present sequence is mouse Stat3 protein fragment containing 130-358 amino acids of Stat3 protein. This Stat3 fragment showed strong binding to c-Jun protein in the cell extract. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of sysproliferative diseases and also for treating cancer and psoriasis. A Stat protein comprises the N-terminal domain, coiled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Stat3-c-Jun interaction region 1; corresponds to 130-154 position of Stat3 protein" 236. .252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse; Stat3 protein; transcription factor; c-Jun; gene transcription; cellular transformation; dysproliferative disease; cancer; psoriasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                              The present sequence is mouse Stat3 mutant protein fragment containing replacing of Stat3 protein. This mutant is obtained by replacing Leu 148 with Ala, val 151 with Ala, Thr 346 with Ala, Lys 348 with Ala and Arg 350 with Ala in the Stat3 protein. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A Stat protein comperises the N-terminal domain, coiled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is mouse Stat3 protein fragment containing 107-377 amino acids of Stat3 protein. This Stat3 fragment showed strong binding to c-Jun protein in the cell extract. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a renacription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of typroliferative diseases and also for treating cancer and psoriasis. A Stat protein comprises the N-terminal domain, coiled-coil domain, bund binding domain, linker domain, SH2 domain and transactivation domain
                                           interaction region 1; corresponds Stat3 protein"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is mouse Stat3 protein fragment containing 107-358 amino acids of Stat3 protein. This Stat3 fragment showed strong binding to c-Jun protein in the cell extract. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of Stat protein comprises the N-terminal domain, colled-coil domain, bind binding domain, linker domain, SH2 domain and transactivation domain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New STAT protein DNA-binding domain peptide(s) - useful for diagnosing, preventing or treating cellular dysfunction, e.g. oncogenesis, inflammation, parasitic disease or autoimmunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mouse signal transducer and activator of transcription (STAT) protein STAT4 (AAM01176) serves a dual purpose, i.e. signal transduction from ligand-activated receptor kinase complexes followed by nuclear translocation and DNA binding to activate transcription. Recombinant STAT4 can be obtd. using cDNA clone 19sf6 (AAT31278) obtd. from splenic/thymic cells. STAT4 includes a DNA-binding domain (see also AAW03167) capable of both receptor recognition and message delivery vi DNA binding in a receptor-ligand specific manner. STAT proteins and the DNA binding domains (see also AAW03165-75) are useful for screening antagonists used to inhibit STAT-mediated signal transduction and activation of transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 NHPTAAVVTEKOOMLEOHLODVRKRVODLEOKMKVVENLODDFDFNYKTLKSQGDMQDLN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A fragment encoding the human Stat91 protein was used to screen a murine thymus and spleen cDNA for homologous proteins. A highly homologous gene (given in AAQ89338) was isolated that encoded a 91 Kna protein (AAR72080) (Stat1) that was responsive to interferon-gamma. Using a fragment of the mouse gene as probe, 2 additional members of the 113-91 family of receptor recognition factor proteins were isolated. The 2 genes (AAQ89339-40) were cloned in plasmids 13sfl and 19sf6 and encoded proteins termed Stat4 (AAR72081) and Stat3 (AAR72082), respectively. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ACIGGPPNICLDRLENWITSLAESQLQTRQQIKKLEELQQKVSYKGDPIVQHRPMLEERI 180

This mutant is obtained by replacing val 151 with Ala in Stat3 protein. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., callular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GNNQSVTRQKMQQLEQMLTALDQMRRSIVSELAGLLSAMBYVQKTLTDEELADWKRRPEI 120
                                                                                                                                                                                               containing 130-158 amino acids of Stat3 protein. This mutant is obtained by replacing Leu 148 with Ala in Stat3 protein. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A Stat protein comprises the N-terminal domain, coiled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NHPTAAVVTEKOOMLEOHLODVRKRVODLEOKMKVVENLODDFDFNYKTLKSOGDMODLN

with necvascularisation. Suppressing an immune response is useful for ameliorating a symptom of an autoimmune disease such as systemic lupus cryptematosus, multiple sclerosis, inaulin dependent diabetes mellitus, sjoyramus, scleroderma, polymyositis, chronic active hepatitis, mixed connective tissue disease, primary biliary cirrhosis, pernicious anaemia, autoimmune thyroiditis, idiopathic Addison's disease, vitiligo, julten-sensitive enteropathy, autoimmune neutropenia, myasthenia gravis, idiopathic thrombocytopenia purpura, Grave's disease, Goodpasture's disease, rheumatoid arthritis, cirrhosis, pemphigus vulgaris, autoimmune confirs and dense deposit disease. The method is useful in preventing or treating specific proliferative and oncogenic disease which includes sarcomas and carrinomas eg., bladder darscinoma, colon carrinoma, chronic leukaemia, fibrosarcoma, liposarcoma, degenerative disorders, growth deficiency, hypoproliferative disorders, physical trauma, lesions and wounds. The criptonic control of the present sequence is human

The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3 (Stat3). Modulating angiogenesis is useful for treating or preventing hypoxic or ischaemic condition or disorder which is the result of stroke, ischaemia, coronary atherosclerosis, myocardial infarction, inflammation, tissue ischaemia in the lower extremities, infarction, trauma, vascular occlusion, prenatal or postnatal oxygen deprivation, suffocation, shock, chronic obstructive pulmonary disease, choking, asphysia, hypoglycaemia, epilepsy, emphysema, adult respiratory distress syndrome, cardiac arrest, nitrogen necrosis, proliferative angiopathy e.g. diabetic microangiopathy

conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic condition-improving drugs or therapeutics for ischaemic condition related sequence, which are used in the exemplification of the present invention
determining the expression profile of a gene group comprising these
                                                                                                                                         present invention describes a method for examining ischaemic
                                                                                 Claim 2; Page 1084-1087; 2690pp; English.

```
The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that condulate the activity of signal transducer and activator of transcription of Stat13). Modulating angiogenesis is useful for treating or preventing thypoxic or ischaemic condition or disorder which is the result of stroke, ischaemia in the lower extremities, infarction, inflammation, trauma, vascular occlusion, prematal or postnatal oxygen deprivation, suffocation, shock, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, chitogen necrosis, proliferative angiopathy e.g. diabetic microangiopathy with neovascularisation. Suppressing an immune response is useful for ameliorating a symptom of an autoimmune disease such as systemic lupus crythematosus, multiple sclerosis, insulin dependent diabetes mellitus, contenting a syndrome, scleroderma, polymyositis, chronic active hepatitis, mixed connective tissue disease, primary biliary cirrhosis, permicious canemia, autoimmune thyroditis, idiopathic Addison's disease, victuating arthritis, discommune neutropenia myasthenia gravis, disease, rheumatoid arthritis, discomia neutropenia, myasthenia gravis, disease, theumatoid arthritis, cirrhosis, pemphygus, ulcerative colitis and dense deposit disease. The method is useful in preventing or treating charging and province of the sease of the sease. The method is useful in preventing or treating specific proliferative and oncogenic disease, premicionic, proliferating and propertions.
                                                                                                                                                                                                                                                                                             Modulating angiogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leukaemia, fibrosarcoma, liposarcoma, degenerative disorders, growth deficiency, hypoproliferative disorders, physical leama, lesions and wounds. The method is also used in gene therapy. The present sequence is human Stat3

Modulating angiogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator of transcription 3.

Disclosure; Page 83-85; 94pp; English.

The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3 (Stat3). Modulating angiogenesis is useful for treating or preventing thypoxic or ischaemic condition or disorder which is the result of stroke, ischaemia, coronary atherosclerosis, myocardial infarction, inflammation, tissue ischaemia in the lower extremities, infarction, inflammation, tissue ischaemia in the lower extremities, infarction, inflammation, tissue ischaemia or postructive pulmonary disease, choking, asphyxia, hypoglycaemia, epilepsy, emphysema, adult respiratory distress syndrome, cardiac arrest, circonic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, epilepsy, emphysema, adult respiratory distress syndrome, cardiac arrest, circonic obstructing a symptom of an autoimmune response is useful for with neovascularisation. Suppressing an immune response is useful for with neovascularisation of an autoimmune disease such as systemic lupus erythematosus, multiple sclerosis, insulin dependent diabetes mellitus, sjogren's syndrome, sclerosis, insulin dependent diabetes mellitus, sjogren's syndrome, sclerosis, insulin dependent diabetes mellitus, sjogren's syndrome, sclerosis, primary bilary cirrhosis, permicious anaemia, autoimmune thyroiditis, idiopathic Addison's disease, or clidopathic thromborytopenia purpura, Grave's disease, connective tissue disease, primary bilary cirrhosis, autoimmune chyroiditis, idiopathic Addison's disease, is a dependent disease. The method is useful in preventing or treating specific proliferative and oncogenic disease which includes sarcommas and carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leukaemia, chypoproliferative disorders, physical trauma, lesions and wounds. The method is also used in gene therapy. The prevent sequence is human expected in gene therapy.

The protein is encoded by a cDNA, isolated from a mouse liver cDNA library using a polymerase chain reaction product (amplified using primers derived from an IL-6-treated mouse liver peptide) as a probe. ARPF inhibitors, e.g. antibodies, antisense oligonucleotides or ribozymes, may be used to treat diseases induced by IL-6, e.g.

The encoding sequence differs from the original published human STAT3 gene sequence (Akira et al., 1994). Host cells comprising a recombinant STAT3 bNA molecule can be used for the recombinant expression of the variant. STAT3 protein is useful as a medicament or pharmaceutical composition for treatment of autoimmune or inflammatory diseases

crystal effectively diffracts X-rays, allowing the determination of the atomic coordinates of the N-terminal domain to a resolution of greater than S.O Angstroms. The present sequence is the N-terminal domain of the murine STAT 3 protein. The N-terminal domain enables STAT dimers to interact and bind DNA cooperatively, a mechanism important for gene activation. The crystals are useful in drug screening and development by selecting a potential drug by performing rational drug design with the 3-dimensional structure determined for the crystal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 GNNQSVTRQKMQQLEQMLTALDQMRRSIVSELAGLLSAMEYVQKTLTDEELADWKRRPEI 120
